TTi Firmware Transfer Utility.

This program can be used to update the firmware on the following TTi products over the USB or LAN interface connection.

TGR2051
TGR2053
QPX750

If using USB, a driver will be required to be installed. For Windows 10 a driver is automatically installed by the operating system when the instrument is connected. For earlier versions of Windows, a driver is available from the Aim TTi support site.

The USB driver installs the instrument as a "Virtual COM Port" which can be selected in this utility from the "COM Port" drop down selection.

For LAN, no driver is required and the values for the IP Address and Subnet Mask must be entered.

The firmware update file is selected by clicking File->Open and locating the ".ttiupd" file downloaded from the Aim TTi support site.

The "Start Update" button should now be clicked and the firmware files will be transferred to the instrument. Once complete the utility will prompt for the instrument to be power cycled which will initiate the update process.
